

Looper CPS Model: Status and Path to Close

For Renold (CFO) | From Ellery, FP&A | 6 October 2026 | Build status. Content Detection (CD) and Webstore. Costs GBP.

The bottom line

- 1. The model now runs on real cost and real scan volumes** for CD and webstore, not the old scans-per-unit assumption. August is closed at a CD cost per scan of £115.33.
- 2. Staff cost is built per person** across 42 people, each carrying an activity time split that drives the pool. This replaces the top-down view and is the main structural change from the prior version.
- 3. September volumes are loaded** (CD 1,738 scan-days, webstore 2,541). September cost is the one remaining input. CPS computes the moment salaries and the cost journal land.

August close

Measure	Value
CD cost per scan	£115.33
CD cost pool	£175,883
CD scans (scan-days)	1,525
CD active devices	178
Webstore cost pool	£106,953

What has been built

- Two CPS outputs, CD and webstore, each from its own cost pool and scan base.
- Real cost from the transaction journals, replacing the flat monthly carry. The 8.667 scans-per-unit assumption is retired.
- Per-person staff engine: 42 people across Customer Success, Product, Operations and Tech. R&D and Manila stay consolidated; HR, Finance and Management sit outside the pool.
- One source per number, so the headline, month on month and the variance bridge stay consistent. Built to remain Google Sheets compatible.

September status

Input	Status
CD scans	Loaded: 1,738 scan-days across 176 devices
Webstore scans	Loaded: 2,541 scan-days across 90 storefronts
Spots	Loaded
Staff cost	Pending: September salaries
Non-staff cost	Pending: September cost journal
R&D and Manila	Pending: September figures

To close out

- Finalise September cost: load September salaries and the cost journal, and enter the R&D and Manila figures. The model is paste-and-go once these land.
- Split staff time between CD and webstore at a finer level, moving away from the current top-down view.
- In the budget meetings, ask each department head (CS, Product, Operations, Tech) for a first-pass time split. Revisit quarterly, or sooner on a major business change.
- Re-check the device listings to confirm each device feeds through with its scan data.
- Once September cost is in, Prad and I reverse engineer the number against the prior version to confirm the drivers.

What is driving the change

The CD cost per scan is higher than previously reported. Two changes account for most of it: real scan volumes replace the old 8.667 scans-per-unit assumption, and staff and overhead cost now split into the CD and webstore pools by activity rather than top down. Prad and I will confirm the split line by line once September cost lands.

- This is the build status view. The September CPS is not final until cost is loaded, so it should not be read as a closed number yet.

Path to close

6 Oct, now

Build complete, September volumes loaded

Step 1

September salaries and cost journal loaded

Step 2

September close computes; Prad and I reconcile vs prior

Step 3

Department-head time splits at the budget meetings

Ongoing

Revisit splits quarterly, or on a major change

August 2026 base. CD CPS, pools and scan counts read live from Looper CPS Model Live v5. Steps gate on the September cost date; firm dates to confirm once that is set.
